

Realtime Data Visualization with D3.js

Project Description (Summary)

The topic of this project is "Realtime Data Visualization with D3.js", focusing on creating interactive visualizations from live, online data sources. The goal is to reflect current trends and conditions in areas such as public health, global awareness, and technology.

The data sources used include:

1. COVID-19 API from disease.sh - Displays real-time data of the top countries with the highest number of confirmed cases
2. World GeoJSON from GitHub - Provides an interactive map with zoom and pan functionality
3. Posts from Reddit (subreddit: /r/javascript) - Used to build a word frequency chart showing the most common terms used by developers in this community

Each visualization conveys the following:

- Bar Chart: Top 5 COVID-19 Countries - Communicates real-time comparisons of case numbers between the most affected countries
- Interactive World Map - Allows users to freely explore global geography and spatial relationships
- Word Frequency (Filtered) - Reveals key terms trending in the developer community, helping interpret current interests and discussions; includes a filter to display only frequently used words
